

RED CHEVRON STUDIOS · ON ROBLOX

WHAT WE KEEP OUT

Four hunters. One monster that eats to grow. By the end of the match, the hunted becomes the hunter.

WHAT WE KEEP OUT is a 4v1 asymmetric monster hunt. Four first-person hunters with real guns and a plan track a player-controlled monster through a living forest, while it feeds on wildlife and fallen hunters to evolve through three stages.

- In closed playtest
- 5 players per match
- 12-minute hunt
- Computer · Phone · Controller
- Free to play, cosmetics only

108	9,572	387k	301	2 · 4 · 2	5 / 5
days from first line of code	commits	lines of type-checked game code	automated test suites on every change	monsters · hunter classes · maps	live testers wanted another match

Counts measured from the project repository on 19 October 2026; the line count leaves out the bots' generated walking maps. First commit 3 July 2026.

THE OPPORTUNITY

Roblox has the audience for a monster hunt. Nobody has built the fight-back version.

The gap

Every asymmetric game on Roblox is a corridor chase: survivors run and hide. The appetite is proven: Forsaken, a hardcore asymmetric game, reached roughly 80,000 players at once and billions of visits. What does not exist on Roblox is the other half of the genre: **armed hunters with a plan, against a monster that grows.**

On PC and console that formula had a devoted audience and a famous collapse. We studied why those games died and designed WHAT WE KEEP OUT against each cause, starting with the first rule below.

The one rule

Both sides must be fun. If only one side is having fun, the game dies.

A 4v1 needs four hunters for every monster, so the hunter side carries four times the population. The bar every feature has to clear: *a solo hunter with three strangers and no mic still has fun in a match they lose.*

SHOOTER

Five hand-built guns with first-person arms, aim-down-sights and authored reloads. Hunters fight back; that is the point.

DEPTH

A tracking economy (wound trails, birds, bells, footprints), a three-stage evolution with upgrade choices, and four classes that need each other.

OLDER AUDIENCE

Atmospheric horror, skill-based combat and short, replayable matches. Built for teens and adults who want a game with depth.

CORE LOOP

Two different games in one match

A monster player and a hunter player want different things. Each side has its own complete loop, and they collide in the fight.

Play the Monster

1. **Stalk.**
   Start weak and hunted. Crouch-stalk, wall-crawl and leap through the forest while four armed players look for you.
2. **Feed.**
   Kill deer, stags and bears (they fight back), and feed on downed hunters to fill your meat meter.
3. **Mutate.**
   Cocoon and evolve through three stages, growing larger, tougher and stronger, and spend points to upgrade your abilities.
4. **Break the Relic.**
   At Stage 3, smash the hunters' Relic, or wipe all four hunters, to win.

Play a Hunter

1. **Track.**
   Read the woods: glowing wound trails, startled birds, tripwire bells, footprints, and the silence where it already ate.
2. **Cage.**
   Close in and raise the team Cage, a plasma jail that pins the monster so the fight happens on your terms.
3. **Fight.**
   Four classes (damage, healer, control, support) combine guns, gadgets and class abilities.
4. **Survive.**
   Revive downed teammates, hold the Relic, and kill it before Stage 3, or run out the clock.

Drop

The monster wakes alone, somewhere new each match; hunters insert across the map.

Hunt

A 12-minute clock. The monster eats; the hunters track.

Contain

The Cage drops. A real fight, or an expensive escape.

Mutate

Stage 1 → 2 → 3. The power curve is the drama.

Endgame

The Relic. Ties go to the hunters, so stalling never wins.

No player is ever left with nothing to do: a downed hunter crawls and calls out intel, a dead one spectates their team and respawns on a timer, and a caged monster can always pay to break out.

THE ROSTER

Two monsters, four hunter classes

MONSTER 1

The Wendigo

A gaunt spirit of famine that grows with every meal: Starved, then Ravenous, then Gorged. **Ground Slam** scatters a clumped team, **Scream** interrupts heals and floods the map with false tracking noise, **Snatch** drags one hunter into the dark, and **Rush** tramples everything in a line. **Sense** reveals prey through walls.

MONSTER 2

The Long Man

A second monster built on positioning and psychic pressure, pickable today. He **Blinks** instead of running, his Sense freezes a psychic image of the hunters, **Echoes** release copies of him to confuse pursuit, **Long Reach** drags a caught hunter while he keeps moving, and **Head Pain** leaves the team dazed.

CLASS	ROLE	WEAPONS	UNIQUE GEAR	CLASS ABILITY
Executioner Damage	The threat that forces the monster to back off	Relic Rifle · Chain Whip	Brand: hits stack sigils, then detonate	Iron Resolve: a damage-soaking stance
Sanctum Healer	All healing and sustain	Hexlock Pistol · Surgical Vial Launcher (lobbed area heals)	Healing Aura: a smashable heal field	Mending Burst: an emergency group heal
Jailer Control	Find the monster, then pin it	Repeating Crossbow (wounds leave a glowing trail) · Tripwire Chimes (alarm bells)	The Net: a harpoon snare	Flare: lights a wide area and reveals the monster inside it
Sage Support	Force multiplier and protection	Consecrated Scattergun (pump shotgun) · Banishing Lantern	Decoy: a double that runs while she vanishes	The Veil: hides hunters from the monster's Sense

Every class is two weapons, one unique piece of gear and one class ability. Every class, and both monsters, live in configuration rather than custom code, which is what makes a new character a content drop instead of a rewrite.

THE WORLD

A forest that tells on you

Most Roblox monster games are corridors. WHAT WE KEEP OUT is an open-world stalk: information warfare across real terrain. Wildlife is a system, not scenery. Herds scatter and birds lift when the monster moves, and the woods go quiet where it has already eaten.

Playing the Wendigo, Stage 1, stalking through the fog.

Sense: the monster's pulse reveals prey through the trees.

BLACKPINE: the reservoir and mill.

BASIN 9: the abandoned village.

BASIN 9: the quarantine road.

Two maps, both playable

BLACKPINE is a dusk boreal forest with a reservoir and dam, a railbed and trestles, a mill, a flume, a quarry and a hunters' camp. **BASIN 9** is a forested, abandoned nuclear-industrial disaster zone. Every match rolls one of the two.

Random wet and dry spells, storms that build, falling pine needles and dead leaves, water, day-long ambience and rare one-off sounds (a far-off wolf, a creaking pine) play on each player's own clock.

A food chain that fights back

Deer flee fast and feed a little. **Stags** fight back and feed more. **Bears** are hostile to everyone and are the biggest meal on the map. Hunters who shoot a herd leave bait behind, not a denied meal.

A world with a story

The game opens on a campfire at night. The lobby is a ranger station at the edge of a closed forest, with its own cast (Kessler, Pell, Brisco and The Unlit, the shopkeeper whose file is all but empty) and **Case Files**: missing-person posters, trail-camera photos and field notes that tell the story of what is out there, one discovery at a time.

EVERYTHING BUILT SO FAR

This is not a prototype. Every system is running.

A full match runs end to end today: five players enter from the lobby, the server assigns one monster and four hunters, the match plays out on either map, and it ends on a scoreboard whose result is saved to every player's profile.

Combat and characters

- Four complete hunter kits: 16 slots, five guns with first-person arms, aim-down-sights and aimed reloads
- Inspect animations for held guns and gear, plus rare 2% reload gags
- Two monsters with full ability sets, traversal (leap, wall-crawl, crouch) and a three-stage evolution with upgrade choices
- Revives, a downed state, pings, sprint, a traversal rig with dodge bursts, and the team Cage
- Server-authoritative damage: a client never decides whether it hit

Match and online

- A match state machine: lobby, drop, hunt, contain, endgame, post-match
- Cross-server matchmaking with a global queue and teleports into match servers
- Parties that queue together, with our own invite panel and Roblox friend invites; if one member leaves, the rest keep searching
- Role preferences with a fair monster rotation: nobody is stuck in a role they hate
- Spectating, leaver and idle handling, and a post-match scoreboard
- Bots fill a thin queue on whichever side the players did not pick, a bot Monster included; VIP hosts run private matches

Lobby and first-time players

- A separate, explorable lobby behind a campfire title screen: find a match from anywhere, the party radio desk, the Store
- A first-time player picks Hunter or Monster on one card before their first search
- A training range with live wildlife, and a two-sided orientation course
- A guided first round, Gear Up, Case Files lore, and Field Notes on every class, monster, piece of gear and camp character
- Characters in the lobby who walk, work and turn to face you when you talk to them

Progression

- XP from every match drives level, eight rank tiers and titles
- Scrip currency from every match; a loss pays nearly as much as a win
- Weekly challenges on their own menu, in the lobby and in the match
- A cosmetic locker and shop, a VIP pass, and a saved last-match summary

Engineering quality

- Every one of the 3,126 source files is strictly type-checked
- 301 automated test suites and a CI pipeline run on every change
- Tuning numbers live in config, so balance changes never touch game logic
- Internal audits on 27 September, 7 October and 9 October; every launch blocker they found is fixed

Every platform, its own build

- **Phone:** our own touch buttons with a separate layout for each role, an editable layout, touch aim assist, phone-specific HUD arrangements and menus laid out to read at phone size
- **Controller:** every menu works on a gamepad, with pad-specific bindings and text sized for the couch
- **Computer:** full keyboard and mouse, rebindable keys
- Settings: graphics presets, HUD size, reticle and audio accessibility

Running it live

- Kill switches for each map, matchmaking, the shop and rewards, flippable without a new build
- A saved record of every match: result, every player's stats and server performance
- Incident records, ban tools and server-side developer permissions
- Every request from a player's device is validated, bounded and rate-limited on the server
- Movement checks that catch speed and hover cheats yet never punish an honest player, even at 300 ms ping
- A private test copy of the whole game: every update is played there before it goes live

LATEST UPDATE · 19 OCTOBER 2026

No empty queues, no forced roles, and a stranger at the bus

The newest update landed on 19 October. Most of it is about a new player's first minutes, and about never leaving anyone alone in an empty queue.

FIRST TIME

Pick your side

A first-time player chooses HUNTER or MONSTER on one card before their first search, and can change it any time in Settings. A Hunter pick spreads new players across all four classes instead of everyone asking for the same one.

BOTS

Bots fill the side you didn't pick

When the queue is thin, bots take the seats the players left open. A Monster fan gets bot hunters; a solo hunter, or a party of up to four, gets a bot Monster that feeds, evolves and goes for the Relic. A solo search fills after 75 seconds.

THE CAMP

The Unlit

A new shopkeeper at the camp's bus: hooded, faceless in the dark, and never seen to step off it. His own Field Notes file is all but empty: *"Pell keeps a file on everyone in camp. His drawer is empty."*

PARTIES

Nobody drops out of the queue

If someone leaves a party mid-search, the rest keep searching at their new size and are told who left, by name.

PHONE

Menus that read on a phone

The Store, My Locker and Field Notes are laid out for a phone's screen, with rows sized for a thumb.

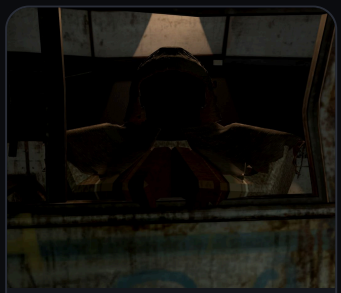

SOUND AND SET

A camp that is all ours

Two new songs join the camp's music, fourteen original tracks in all. The bunkhouse wears our own wanted posters for the Wendigo and the Long Man, its house rules and the crew roster, and a standing Cage now hums.

The first-time card: one choice, changeable any time.

The Unlit, at the bus window.

His Field Notes file, kept in the dark.

The title screen: the campfire, at night.

WHERE IT STANDS TODAY

The question is no longer "is it fun?"

> "All five players had genuine fun and wanted to go again immediately after the fourth match."

Proven

- **Several closed beta sessions** through August 2026, all positive.
- **The first live five-player session** on published Roblox servers, 15 September 2026: four matches across both maps.
- Every player's pay, XP and match record saved exactly once.
- Matchmaking, arrival and match records ran with no incidents.
- The server held about 60 frames a second with five players and a full herd of wildlife.

Honest about what's next

- The hunters won all four live matches, and nobody called it unfair. We tuned the monster's early game right after.
- No match has reached Stage 3 with real players yet; the next session tests it.
- The game is not public yet. Every blocker the October launch audits found is fixed; launch still needs a re-audit, a certified release, a second live session and a real-phone performance baseline.
- Strangers on public servers, matchmaking across two live lobby servers, purchases, crash-rejoin, bot matches and private matches still need proof on published servers.

MONETIZATION

Free to play. Cosmetics only. Never pay-to-win.

In a 4v1, anything sold as power ruins the match for the other four players. Power lives inside the match (the monster's evolution); identity lives outside it (skins, titles, emotes).

LIVE IN THE BUILD TODAY

A two-currency cosmetic shop

Every cosmetic can be earned with Scrip, which every match pays (a loss pays nearly as much as a win), or bought with Robux. 116 priced items today:

Premium monster bodies (7)	**R$400 · 4,000 Scrip**
Premium weapon skins, with their own effects (16)	**R$400 · 4,000 Scrip**
Monster recolours (12)	**R$250 · 1,500 Scrip**
Hunter outfits (12)	**R$200 · 1,000 Scrip**
Kit item skins (6)	**R$200 · 1,000 Scrip**
Weapon finishes (36)	**R$99 · 500 Scrip**
Emotes (27)	**R$50 · 250 Scrip**

Grind or pay: a premium skin is about 53 matches of play, or R$400. Seven Robux products and the VIP pass are live in the build, and the shop shows each player Roblox's own price for their region (the prices above are list prices); the first real purchase on a public server is part of launch prep.

BUILT NOW, AND WHAT COMES NEXT

Pass, seasons and roster

- **VIP pass (built and priced since 7 October, R$599):** +15% match XP (never currency), 8 emote slots instead of 4, a skull mark by your name and a burning name when you play the monster, a voucher for one skin of your choice, and hosting private matches with custom rules.
- **A seasonal cosmetic track** with themed skins each season.
- **New monsters and hunters** unlockable with either currency.
- **Monster skins stay the lead product.** In this genre, monster players are the biggest spenders, and every skin is seen by the four hunters it is chasing.

Never sold: damage, health, abilities, extra respawns, match advantages or loot boxes. The genre's graveyard is full of games that tried.

LIVE OPERATIONS

Built to update every week

ALREADY BUILT

The machinery is in place

- **Weekly challenges:** five goals drawn each week from a pool of 38, never repeating the last three weeks; finish any three for XP and Scrip. This is the deliberate return hook. There is no daily login reward, because a 4v1 needs players queuing together, not just logging in.
- **Case Files:** 23 lore entries that reveal the story over time.
- **Kill switches** for purchases, matchmaking, rewards and each map, flipped live without a new build.
- **Match records and analytics:** every match saves its result, each player's stats and server performance, plus onboarding-funnel and shop analytics.
- **Live balance tuning** without a new build is built and held in reserve for after launch.
- **Bots** fill a thin queue on whichever side the players did not pick, so the five-player match starts even before the player base is big.

THE CONTENT CADENCE

New monsters are the hype spike

- **Characters are data, not code.** The Long Man went from settled design to pickable in the match in about a week, without touching the Wendigo. That is the business model: a new monster is a content drop, not a rewrite.
- **Monster concepts on file:** the Jersey Devil (verticality), the Sasquatch (it attacks the hunters' tracking) and the Rougarou (contagion).
- **A second character for every hunter class**, each with its own kit.
- **Dynamic map events:** one announced hazard at a time (a zone closing, a storm that gives the monster cover to feed) as a cheap weekly change.
- **More maps:** each map is its own place that joins the queue's roll, exactly as BASIN 9 did.

TIMELINE

108 days in, and the road to launch

JULY 2026

From four grey blocks to a game

First code on 3 July; the feed-and-evolve loop the next day. Then the design thesis, the four hunter kits, saved player profiles, the BLACKPINE map rebuild, the first phone controls and the separate lobby place.

AUGUST 2026

A full game

Cross-server matchmaking (5 August), account progression (levels, ranks, titles), the shop with Scrip earning switched on, and the second monster, the Long Man, pickable from 28 August. Several closed beta sessions, all positive.

SEPTEMBER 2026

Real players, real servers

BASIN 9 joins the map rotation and the Robux shop is built (3 September). The first live five-player session on published servers (15 September). Separate phone and controller layouts for the HUD, menus and controls. A full internal audit on 27 September found no launch blockers. The final name, WHAT WE KEEP OUT (28 September), then bot hunters and private matches (29 September).

OCTOBER 2026

A store worth opening, and a queue that never sits empty

The Store and My Locker rebuilt for computer, phone and console, premium gun skins with their own effects, and the VIP pass built and priced (7 October). Launch audits on 7 and 9 October, and every blocker they found fixed. A private test copy of the whole game, bots that read trails and answer calls, and on 19 October The Unlit, the first-time role pick and bots that fill whichever side the players did not pick.

NOW

Launch prep

A re-audit, a second live session that reaches Stage 3, a certified release, a real-phone performance baseline, and live proof of purchases, crash-rejoin and matchmaking across two lobby servers.

TARGET: Q4 2026

Public launch

The experience goes public. This is where launch support and user acquisition make the difference, because the first weeks decide whether the queue fills.

AFTER LAUNCH

Season one

A seasonal cosmetic track, the third monster, and dynamic map events.

THE TEAM

One director, and a disciplined AI engineering pipeline

FOUNDER & CREATIVE DIRECTOR

Anthony Claudio

Owns the design, the feel and every final call. Nothing counts as done until he has played it: every weapon, camera and animation in the game was accepted or rejected by him in Roblox Studio. He runs the playtests, the roadmap and the studio, Red Chevron Studios.

ENGINEERING

AI coding agents, run like a team

The code is written by AI coding agents (Anthropic's Claude Code, with OpenAI's Codex on some tasks) working under a written engineering rulebook: the server owns gameplay truth, every tuning number lives in config, and no change lands until the automated gate passes. That is how one director produced 9,572 commits in 108 days without the codebase rotting.

ART AND AUDIO

An original look, with receipts

Original characters, monsters, maps, logo and UI. The pipeline mixes custom 3D models and animation, AI-assisted concept, texture and sound generation, and licensed source assets. Every asset is tracked with a written receipt and published under the studio's Roblox group.

PLAYTESTERS

Real players, early

A closed beta group has played every major version, and a community builder, bigwuggy, has helped build the lobby from the start. Every live match writes a record of its result, each player's stats and server performance, so each session produces data as well as opinions.

WHAT SUPPORT WOULD UNLOCK

A 4v1 lives or dies on having five people in the queue at once

The design problem that killed this genre elsewhere is population: a match needs five players, at once, in one queue. The game is built. What decides whether it lives is the first weeks after it goes public.

Launch-day players

Help with on-platform and off-platform user acquisition at launch turns the genre's biggest risk, empty queues, into its biggest strength: a full lobby of people who all want to go again.

Expert eyes on retention and monetization

Weekly challenges, the cosmetic shop, the VIP pass and progression are built. We want Roblox's view of what older players stay for, and where a season track and passes should sit.

Phones and low-end devices

Phone controls and layouts are built for every role. Guidance on rendering and memory budgets for mid-range phones would shorten the road to a certified release.

The "Wait, that's Roblox?" bar

The monsters are custom-built creatures; the hunters are R15 bodies with custom outfits, gear and first-person arms. We want to push hunter fidelity further, and would value guidance on high-fidelity avatars.

Talk to us

WHAT WE KEEP OUT is in closed playtest. Playtest access, a live walkthrough in Roblox Studio or a deeper look at any system is available on request.
